

Peakless vs bonkers.ie

Which is more accurate, easier and better for an Irish home choosing an electricity plan. Tested 5 October 2026 with three homes whose real yearly cost is known to the cent.

MORE ACCURATE
Peakless
With a meter file, Peakless was within 0.2–0.8% of the true cost on average for every home and picked the cheapest plan each time. bonkers.ie missed the cheapest plan for one home and was 12.5% out on average for the EV home.

EASIER
Peakless, just
3 taps from meter file to a full ranking, against 12 on bonkers.ie (plus downloading the file for either). Typed-in usage is close: 11 taps against 13.

BETTER OVERALL
Depends on the job
bonkers.ie lists more plans (Ecopower and a few others Peakless lacks), handles gas, switches you itself and is CRU-accredited. Peakless prices every hour, models solar, batteries and cars, and tells you why.

How it was tested

Three homes with a known answer. Each is a full year of half-hourly smart-meter readings in ESB Networks' own download format (the "HDF" file a customer gets from esbnetworks.ie). Because the readings are known, the true cost of every plan over the next 12 months can be worked out exactly: every half hour priced at the supplier's published rate for that hour, announced price changes from the date they start, the standing charge and the €6.67 PSO levy.

Home	What it is	kWh a year	Truly cheapest plan	True cost
1. Typical	ESB Networks' standard urban home (Load Profile 1), with day-to-day variation	4,200	Energia Smart 24 Hour	€1,511
2. Night-heavy	ESB's Nightsaver home (Load Profile 2): a lot of use overnight	5,000	Electric Ireland Home Electric + SST Saver 16%	€1,674
3. EV home	Home 1 plus an electric car charging 2am–5am	6,700	Flogas Smart EV Night Charge 29%	€1,922

Two ways in, on each site. (a) Typing the yearly kWh, the way most people use these sites. (b) Uploading the meter file, the most accurate option both sites offer. Same answers everywhere: urban, smart meter, direct debit, no solar, no cashback. For the EV home, "optimise for EV" on bonkers.ie and the car's mileage on Peakless.

Scored on: how far each site's yearly cost was from the true cost, plan by plan, and whether its number-one plan really was the cheapest. If not, how much the reader would lose a year by following it.

Accuracy

With the meter file uploaded: the fair test

Home	Site	Average error	Worst plan	Plans within 3%	Its number one	Cost of following it
1. Typical	bonkers.ie	0.6%	4.5%	12 of 13	Flogas Smart 24hr 29%	€27 a year
	Peakless	0.4%	0.9%	31 of 31	Energia Smart 24 Hour	€0
2. Night-heavy	bonkers.ie	1.4%	4.5%	10 of 13	EI Home Electric SST 16%	€0
	Peakless	0.2%	0.4%	31 of 31	EI Home Electric + SST Saver 16%	€0
3. EV home	bonkers.ie	12.5%	20.9%	1 of 12	Flogas Smart EV Night Charge 29%	€0
	Peakless	0.8%	4.1%	28 of 31	Flogas Smart EV Night Charge 29%	€0

For the EV home, bonkers.ie picked the right plan but priced it at €1,620 against a true €1,922: about €300 too cheap, so its quoted saving was overstated by the same amount. For every home bonkers.ie warned that "some of your usage data is incomplete" and filled gaps with estimates, although each file held a complete year; that is the likeliest cause. It also showed only its top 15 plans after an upload; "show more" did not load the rest.

With only the yearly kWh typed in

Home	Site	Average error	Worst plan	Its number one	Cost of following it
1. Typical	bonkers.ie	3.2%	9.3%	EI Home Electric SST 16%	€33 a year
	Peakless	0.0%	0.2%	Energia Smart 24 Hour	€0
2. Night-heavy	bonkers.ie	1.2%	5.6%	EI Home Electric SST 16%	€0
	Peakless	3.8%	9.8%	Energia Smart 24 Hour	€71 a year
3. EV home	bonkers.ie	3.1%	8.5%	Flogas Smart EV Night Charge 29%	€0
	Peakless	0.2%	0.7%	Flogas Smart EV Night Charge 29%	€0

Read this table with care. With only a yearly figure, each site has to assume when the home uses its power. Peakless assumes ESB's standard home (Home 1's shape); bonkers.ie assumes ESB's Nightsaver home (Home 2's shape) for every smart meter. So each site scores almost perfectly on the home that matches its own assumption and worse on the other. That is not luck on either side: it shows the assumption matters more than

anything else when no file is given. ESB's standard profile is what the market itself uses for a typical home without night storage heating, which is most homes, so Peakless's assumption fits more homes. But a night-heavy home that types in only a number gets a better answer from bonkers.ie.

Ease

	bonkers.ie	Peakless
Questions before an answer (typed usage)	11, all on one long page: supplier, area, meter, payment, current plan, how to give usage, kWh, export, EV, cashback, sign-up only	7, one at a time: usage, meter, area, supplier, plan, discount, heating
Taps to an answer (typed usage)		13 11 (15 with a car)
Taps from meter file to a ranking		12 3
Plans shown after a meter file	Top 15 only	All plans that suit the meter
Can enter € bill instead of kWh	Yes	Yes
Upload a bill instead	Yes (bill reading)	No
Switch from within the site	Yes, for partner plans	No: links to the supplier

Taps were counted by scripting the same journey on each site. Times are not compared because bonkers.ie runs on a server over the internet and Peakless works on the phone, so a stopwatch would measure the network, not the design.

Coverage and features

	bonkers.ie	Peakless
Smart-meter electricity plans compared	48–50	31 (46 in all, with 24-hour and Nightsaver plans for other meters)
Plans the other lacks	Ecopower (2), Energia EV Smart Drive Plus and Energia SST, Yuno Smart EV and Standard Smart, SSE loyalty tiers	PrepayPower's plans (bonkers.ie shows them only to prepay customers)
How usage is priced	A fixed day/night/peak split for typed usage; the file for uploads	Every hour of the year, from ESB's standard profile or the file
Urban/rural, meter type	Yes	Yes (added today)
Announced price rises	Included	Included, for the part of the year they apply

Gas and dual fuel	Full comparison	Five suppliers' gas, for dual-fuel homes
Solar panels, battery, export	Export yes/no only	Full model: size, roof, payback, export earnings
Electric car	"Optimise for EV" switch	Mileage and car; charging placed in the cheap hours
Why a plan wins	Line-by-line calculation per plan	Bill, hours, accuracy and solar explained
Regulator accreditation	CRU-accredited since 2012	Not accredited
How it makes money	Commission from suppliers when you switch through it	None from suppliers

What the test changed in Peakless

- **Meter-file bug, fixed.** The first run had Peakless pick the wrong plan for the EV home, about €70 a year from the cheapest. ESB stamps each half hour with its end time; Peakless moved every reading back a whole hour, so half of them landed an hour early and overnight car charging slipped out of the cheap window. Fixed and covered by a new test; the results above are after the fix.
- **Earlier the same day,** the first comparison had already found SSE's 5 October price rise (now in), Nightsaver plans offered to smart-meter homes (no longer), the missing urban/rural choice (added) and a hand-set usage curve (replaced by ESB Networks' standard profile).

Limits of this test

- **The homes are synthetic.** They are built from ESB's own published profiles with day-to-day variation, not from real customers' meters. Real homes are messier, especially for the typed-usage test.
- **The "true" cost uses published prices as Peakless reads them.** Every rate was checked against the supplier's page or matched bonkers.ie's, except Energia, whose page today says 27% off where bonkers.ie shows 23%. Where the two sites disagree on a price, the error is counted against bonkers.ie. If Energia's 12 October prices turn out as bonkers.ie shows, its Home 1 pick would be closer than shown here.
- **Plans only one site lists are left out of the error figures,** as they cannot be checked against both.
- **Three homes, one area (urban), one day.** Rural homes, solar homes and gas were not part of this test.

What would close the remaining gaps

- **Peakless:** add Ecopower and the Energia and Yuno plans it lacks; check Electric Ireland Night Boost's standing charge; and, for typed usage only, ask one question about night use (a timed immersion, storage heating) so a night-heavy home is not priced as a typical one.

- **bonkers.ie (for the record):** a typical smart-meter home is priced on the Nightsaver profile, which overstates night use; uploads are flagged as incomplete when they are not; and only 15 plans are shown after an upload.

Follow-up, same day: the three gaps closed

Gap	What was done	Effect
Plans Peakless lacked	Ecopower's two smart plans added from Ecopower's own price page (Standard Smart 10% and Smart 24hr 10%), urban €302.37 and rural €334.19 standing. bonkers.ie's other "missing" plans turned out to be Yuno's two EV plans under other names (already in Peakless) and two Energia plans that Energia's own new-customer list does not offer.	Every smart plan Energia, Yuno and Ecopower publish for new customers is now ranked. Ecopower's page prints 2024 prices ex VAT and differs from bonkers.ie (37.9c against 35.5c a kWh on the 24-hour plan); the supplier's page is used and the conflict is noted on the plan.
Electric Ireland Night Boost standing charge	Electric Ireland does not print it. €328.54 (bonkers.ie's figure) is the only standing charge that reproduces Electric Ireland's own estimated annual bill for the plan (€1,595); Peakless's €250.77 cannot. Corrected.	Night Boost is about €78 a year dearer than Peakless showed.
Night-heavy homes with typed usage	One question for a gas-heated home that types its usage: "Is water heated at night on a timer?" A yes moves that use into the small hours.	Home 2 (night-heavy), typed usage: average error 3.9% → 1.0% , and the cheapest plan is now picked (was €71 a year off).

Run on 5 October 2026. bonkers.ie was used through its public comparison form in a browser, one session at a time and slowly; its data API, which its robots file bars, was not used. Raw results and scripts are kept with the Peakless repository.
